The Tempest Data voice Gateway lets you connect locally and communicate globally. Use

the Internet to make toll quality, international telephone and fax calls for next to nothing.

Add voice and fax to your existing leased line data network. Reduce communications costs

between branch offices by combining and compressing voice and data circuits. Voice

enable your web site and connect your remote workers with your call center. Be your own

Telephone Company. The Tempest Data Voice Gateway. Low cost. High performance.

The Franklin Telecom Tempest Data/Voice Gateway is a complete Internet Telephony solution providing low cost, high performance global connectivity. The Tempest can unite geographically distributed workgroups seamlessly integrating voice and fax over an existing LAN/WAN data network. Use our Microsoft NT BackOffice™ based integrated accounting, debit card billing, authentication, mapping and least cost routing software and become your own International telephone company. The Tempest DVG is the new “gold standard” for serious Internet telephony communications.

Internet Telephony—cost effective connectivity and communications for the rest of us! The Internet is a rich, interactive, multi-media experience that has redefined the global economic landscape. The Internet is everywhere!

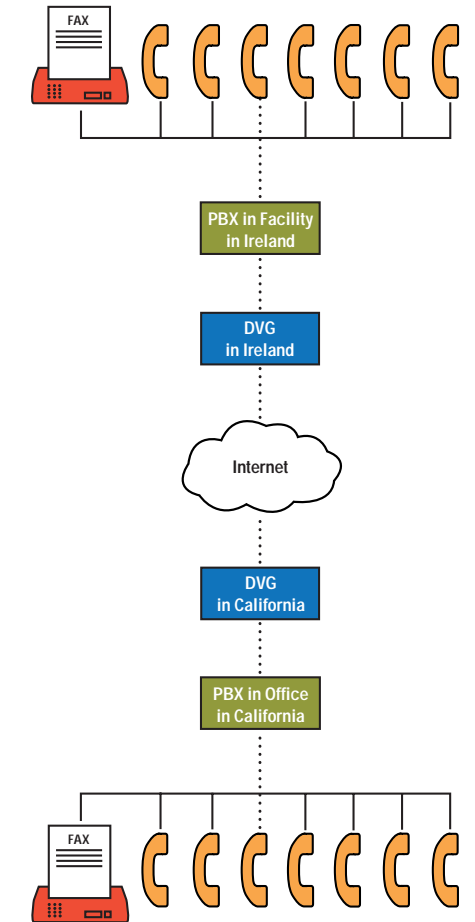

Why not harness the power of the Internet to bring people together? Not just with words and pictures, but with clear, quality, real time voice communications! Web enable your customer care call centers with Internet voice communications. Create order entry and on-line shopping and other e-commerce solutions. Enable remote workforce connectivity. Create virtual workgroups and bring real life to your company's “telecommuter” initiative. Use the public Internet or use your own private Intranet. The Franklin Tempest is more than a gateway for a “cheap phone call”. It is the power to enable real business communications solutions over the Internet.

The Franklin Tempest Data Voice Gateway easily installs between two telephone networks and uses the public Internet or a private Intranet to complete phone calls between the networks. Typically,

these telephone networks are geographically remote and would normally result in a long distance charge from the phone company in order to complete a call from one location to another. Using emerging industry standards for voice and fax compression, the same bandwidth that previously supported only one voice connection can now carry 8 voice conversations. If your company's business operation is global, the ROI for the purchase of a Franklin Tempest solution might be measured in hours, not years!

For example, a company with an office in California and a manufacturing facility in Ireland would place a Tempest Data/Voice Gateway in both offices and connect them to the Internet. Long distance charges between the two locations would be eliminated. California office workers would effectively be making local telephone calls to Ireland!

Does your company have a PBX at the headquarters and leased data lines to the branch offices to support a local area network? A Franklin Tempest installed at either end of that data connection would eliminate more expensive toll traffic between these offices by integrating the PBX phone calls with the data network.
